Voltage is a potential of electrical flow (concentrated charge relative to the rest of the circuit. Current is the flow of electrons. As the current flows, the voltage drops, unless resupplied. Resistance is the resistance o the current flow. More resistance, more voltage drop across the resistor (the resistor burns up electrical potential).

Voltage, current, resistance, power ... - uk.answers.yahoo.com

Best Answer: V = I*R, in words, voltage = current times resistance So voltage and resistance are directly proportional So current and resistance are inversely proportional (as one goes up the other goes down). For example, if you double the resistance something across a fixed voltage, current will cut in half.

Does resistance in an electric circuit affect current and ...
To be very pedantic Ohm's Law is not resistance= voltage/ current, that just follows from the definition of resistance, but rather that the ratio of voltage to current is a constant. Ohm's Law does not hold for all devices, e.g. a diode has an exponential relationship between current and voltage.
