DNA is a long polymer made from repeating units called nucleotides. The structure of DNA is dynamic along its length, being capable of coiling into tight loops and other shapes. In all species it is composed of two helical chains, bound to each other by hydrogen bonds. Both chains are coiled around the same axis, and have the same pitch of 34 angstroms (Å) (3.4 nanometres).

The temporal order of DNA replication (replication timing [RT]) is highly coupled with genome architecture, but cis-elements regulating either remain elusive. We created a series of CRISPR-mediated deletions and inversions of a pluripotency-associated topologically associating domain (TAD) in mouse ESCs.

DNA replication takes place in 5'→3' direction. This means that bases will be added from left to right direction. The template strand will guide this process by telling the new strand which base comes next, this will go on until the new strand is complete and the DNA will once again be double-stranded.

DNA repair is a collection of processes by which a cell identifies and corrects damage to the DNA molecules that encode its genome. In human cells, both normal metabolic activities and environmental factors such as radiation can cause DNA damage, resulting in as many as 1 million individual molecular lesions per cell per day. Many of these lesions cause structural damage to the DNA molecule ...

Junk DNA is a popular term for DNA that does not contain genes. This is non-coding DNA. Most of the genome consists of non-coding DNA. Because it does not code for specific function, it was long thought to be “junk.”
