The only statistic you get in most web analytics software is screen resolution. But there is a pretty good chance you just read this sentence in a browser that isn't open to the full size of your monitor. If you are looking at size analytics for your website, browser size is far more relevant. In this article we figure out how to get that data, and then look at some of the results gathered from ...

Screen Resolution ≠ Browser Window | CSS-Tricks

Here are some great resolution takeaways from Ryan Van Etten, the plugin's author: 2 unit sets exist and differ at a fixed scale: device units and CSS units. Resolution is calculated as the number of dots that can fit along a particular CSS length. Unit conversion: 1in = 2.54cm = 96px = 72pt; CSS has relative and absolute lengths.

css - Detect if a browser in a mobile device (iOS/Android ...

width versus device-width. In CSS media the difference between width and device-width can be a bit muddled, so let's expound on that a bit. device-width refers to the width of the device itself, in other words, the screen resolution of the device. Let's say your screen's resolution is 1440 x 900. This means the screen is 1440 pixels across, so it has a device-width of 1440px.
