Methods of Geological Dating: Numerical and Relative Dating

Earth is the third planet from the Sun, and the only astronomical object known to harbor life. According to radiometric dating and other sources of evidence, Earth formed over 4.5 billion years ago. Earth's gravity interacts with other objects in space, especially the Sun and the Moon, Earth's only natural satellite. Earth revolves around the Sun in 365.26 days, a period known as an Earth year.

When we reach slide 6 of the presentation, I distribute the "letter cards" (one set per table), and tell the students that their first task is to organize them in order, with oldest (CT) at the bottom. I explain that "new letters" cannot just appear, there has to be something linking each of the cards to the next.

Editor's note: Biblical creationists have not reached a consensus on one Ice Age model. This article represents one view. Differences between the models have no major bearing on the overall timescale of a straightforward reading of Scriptures, i.e., the Flood of Genesis 6, which occurred roughly 4300 years ago, brought on one major Ice Age that lasted a few hundred years.

Radiometric dating, radioactive dating or radioisotope dating is a technique used to date materials such as rocks or carbon, in which trace radioactive impurities were selectively incorporated when they were formed. The method compares the abundance of a naturally occurring radioactive isotope within the material to the abundance of its decay products, which form at a known constant rate of decay.

21 Reasons to Believe the Earth is Young. 3 In radioactive decay, a radioactive element (the parent) decays into another element (the daughter) over time. When dating a rock, geologists assume that there was initially no daughter elements present in the rock—only parent elements when the decay began.
