In differential calculus we start with a function  $f(x)$  and we then find the relationship between  $f(x)$  and its various derivatives. Differential equations is the inverse of this process. That is we start with the relationship between  $f(x)$  and its various derivatives, from which we are required to determine what  $f(x)$  is.

In mathematics, differential calculus is a subfield of calculus concerned with the study of the rates at which quantities change. It is one of the two traditional divisions of calculus, the other being integral calculus, the study of the area beneath a curve.. The primary objects of study in differential calculus are the derivative of a function, related notions such as the differential, and ...
