Early Start & Early Finish Calculation. Starting with the critical path, the Early Start (ES) of the first activity is one. The Early Finish (EF) of an activity is its ES plus its duration minus one. Using our earlier example, Activity 2 is the first activity on the critical path: $ES = 1$, $EF = 1 + 5 - 1 = 5$.

The first activity of critical path analysis is to draw a schedule network diagram. The critical path analysis uses Precedence Diagram Method (PDM) to construct the schedule network. Further, PDM method uses Activity-on-Arrow (AOA) diagramming technique to represent the schedule logic. In AOA the nodes represent the schedule activities.

As you can see, the critical path method or critical path analysis is very useful for determining activities that can lead to project delay. Critical path examples can get complex, but in theory the critical path method and critical path definition is always the same and follows the steps mentioned in this article.

critical events and lie on the critical path, but an activity that goes from one critical event to another critical event is not necessarily a critical activity. Because of this, the idea of float is often more useful than the idea of slack. For Example 1 above, the floats for each activity and the slack for each event are as follows:

At its heart, the Critical Path Method is essentially an algorithm for decision making. This algorithm takes a task's start time, its duration, and finish time to figure out which activities deserve the most attention (i.e. are "critical" for the project). Let's consider an example to understand the critical path algorithm better.
