Key Concepts and Summary. Chemical reactions require collisions between reactant species. These reactant collisions must be of proper orientation and sufficient energy in order to result in product formation. Collision theory provides a simple but effective explanation for the effect of many experimental parameters on reaction rates.

According to the collision theory, there are two ways to increase reaction rate: increase the frequency of collisions, and increase the fraction of collisions that are effective. If you speed up the particles by increasing temperature, there is a greater likelihood that they will bump into one another, and the reaction rate goes up.

Collision theory, theory used to predict the rates of chemical reactions, particularly for gases.The collision theory is based on the assumption that for a reaction to occur it is necessary for the reacting species (atoms or molecules) to come together or collide with one another.Not all collisions, however, bring about chemical change.

collision theory | Definition & Explanation | Britannica.com

Collision theory is a theory that was proposed independently by Max Trautz in 1916 and William Lewis in 1918. The collision theory states that when suitable particles of the reactant hit each other, only a certain fraction of the collisions cause any noticeable or significant chemical change; these successful changes are called successful collisions.
