Methane (US: / ' m ε θ eɪ n / or UK: / ' m i: θ eɪ n /) is a chemical compound with the chemical formula CH<sub>4</sub> (one atom of carbon and four atoms of hydrogen). It is a group-14 hydride and the simplest alkane, and is the main constituent of natural gas. The relative abundance of methane on Earth makes it an attractive fuel, although capturing and storing it poses challenges due to its ...

1.. Introduction Methane (CH<sub>4</sub>) is the most abundant organic trace gas in the atmosphere. Concentrations of CH<sub>4</sub> have more than doubled since pre-industrial times, with a current globally-averaged mixing ratio of ~1750 ppbv (NOAA CMDL data, Dlugokencky, personal communication). The effects of CH<sub>4</sub> on climate and atmospheric chemistry are the reason for concern over its high growth rate.

In this paper we present a comparative life cycle assessment of two processes for the industrial production of methanesulfonic acid. The conventional multi-step process for the production of methanesulfonic acid is based on the reaction of methanol and hydrogen sulfide to form methanethiol which is used to produce dimethyldisulfate.

Accurate assessment of anthropogenic carbon dioxide (CO<sub>2</sub>) emissions and their redistribution among the atmosphere, ocean, and terrestrial biosphere – the “global carbon budget” – is important to better understand the global carbon cycle, support the development of climate policies, and project future climate change. Here we describe data sets and methodology to quantify the five major ...

Carbon dioxide (CO<sub>2</sub>) is the primary greenhouse gas emitted through human activities. In 2017, CO<sub>2</sub> accounted for about 81.6 percent of all U.S. greenhouse gas emissions from human activities. Carbon dioxide is naturally present in the atmosphere as part of the Earth's carbon cycle (the natural circulation of carbon among the atmosphere, oceans, soil, plants, and animals).
