**Digital Resolution Chart**

The display resolution or display modes of a digital television, computer monitor or display device is the number of distinct pixels in each dimension that can be displayed. It can be an ambiguous term especially as the displayed resolution is controlled by different factors in cathode ray tube (CRT) displays, flat-panel displays (including liquid-crystal displays) and projection displays ...

Most of the newer digital cameras have plenty of resolution for beginning photographers to make reasonably sized prints, which means the maximum resolution in a digital camera isn't as important as it used to be. In other words, most new digital cameras can shoot what are considered high-resolution photos.

4K resolution, also called 4K, refers to a horizontal display resolution of approximately 4,000 pixels. Digital television and digital cinematography commonly use several different 4K resolutions. In television and consumer media, 3840 × 2160 (4K UHD) is the dominant 4K standard, whereas the movie projection industry uses 4096 × 2160 (DCI 4K). ...

The iPad has consistently been the best of the best in the world of tablets. Each new release seems to set a new threshold, with the latest iPad Pro rivaling the power of most laptops. But while it is easy to choose an iPad, it is not so easy to narrow that choice down to a specific iPad. The iPad lineup is now broken into the Pro level of tablets to go along with the basic iPad models.

Although the megapixel race has been going on since digital cameras had been invented, the last few years in particular have seen a huge increase in resolution – we have seen everything from 41 megapixel camera phones to now 50.6 megapixel full-frame DSLR cameras. It seems like we have already reached the theoretical maximum for handling noise at high ISOs with the current generation sensor ...

Thanks for a VERY useful site, Carlton, which I have used several times since HD TV sets came out some years back. Just replaced a 5 year old 50" plasma set (that developed a horizontal line) with another 51" plasma set, 720p, (\$399), same brand (it was easy to put all the connections in the same places and not have to use a different remote).

IMPORTANT ADVICE: Never turn off any\* digital equipment. It usually takes around 2 days of playing for it to "break in" and sound optimum. Once turned off, you have to go through the entire cycle all over again. Accordingly, do not judge digital equipment unless it has been on and operating for at least 48 hours. This is true for even "budget" players.

The loss of display quality by running mismatched resolutions on an LCD screen can be minimal depending on your choice of settings, but it's definitely something you need to be aware of.

Most of us are familiar with the frequency of sound, which is perceived as pitch and measured in cycles per second, now called Hertz. Audio components— amplifiers, loudspeakers, etc.— are characterized by frequency response curves. MTF is also a frequency response, except that it involves spatial frequency— cycles (line pairs) per distance (millimeters or inches) instead of time.

Because resolution varies over the image for most cameras and lenses, the chart should not take up too much of the frame. The active chart height (the Star diameter) should be between about 500 and 2000 pixels, with at least 800 pixels recommended for high resolution cameras. For typical high resolution cameras the active chart height should be no more than about 1/3 to 1/2 of the total image ...

In Digital cameras vs. film, parts 1 and 2, we use the tools developed in earlier in the series to compare digital and film cameras, and we address the question, "How many pixels does a digital sensor need to outperform 35mm film?" The answer is less speculative than it used to be: The 11+ megapixel Canon EOS-1Ds, EOS-1Ds Mark II, and EOS 5D clearly outperform 35mm.
