Classical Mechanics, John R. Taylor

Celestial motion, without additional forces such as thrust of a rocket, is governed by gravitational acceleration of masses due to other masses. A simplification is the n-body problem, where the problem assumes some number n of spherically symmetric masses. In that case, the integration of the accelerations can be well approximated by relatively simple summations.

This section relates a historically important n-body problem solution after simplifying assumptions were made.. In the past not much was known about the n-body problem for $n \geq 3$. The case $n = 3$ has been the most studied. Many earlier attempts to understand the Three-body problem were quantitative, aiming at finding explicit solutions for special situations.

Physicist and saxophonist Stephon Alexander has argued in his many public lectures and his book The Jazz of Physics that Albert Einstein and John Coltrane had quite a lot in common. Alexander in particular draws our attention to the so-called "Coltrane circle," which resembles what any musician will recognize as the "Circle of Fifths," but incorporates Coltrane's own innovations.
