Daniel V. Schroeder: An Introduction to Thermal Physics Here are my solutions to various problems in the textbook An Introduction to Thermal Physics, by Daniel V. Schroeder (Addison-Wesley, 2000). Obviously I can't offer any guarantee that all the solutions are actually correct, but I've given them my best shot. After some consideration, I've decided to repost this index to the solutions.

The thermal conductivity of a material is a measure of its ability to conduct heat. It is commonly denoted by  $k$ ,  $\kappa$ , or  $\lambda$ . Heat transfer occurs at a lower rate in materials of low thermal conductivity than in materials of high thermal conductivity.

In physics, a field is a physical quantity, represented by a number or tensor, that has a value for each point in space-time. For example, on a weather map, the surface temperature is described by assigning a real number to each point on a map; the temperature can be considered at a fixed point in time or over some time interval, if one wants to study the dynamics of temperature change.

A stretchable organic solar cell was fabricated by spin-coating the transparent electrode and active

layer on a pre-strained elastomeric membrane. Upon release of the pre-strain, the device buckled. The topographic waves that arose imparted elasticity to the device under tensile strain (up to 27%).
