In late October 2010, Mount Merapi in Central Java, Indonesia began an increasingly violent series of eruptions that continued into November. Seismic activity around the volcano increased from mid-September onwards, culminating in repeated outbursts of lava and ashes. Large eruption columns formed, causing numerous pyroclastic flows down the heavily populated slopes of the volcano.

2010 eruptions of Mount Merapi - Wikipedia

Mount St. Helens is 34 miles (55 km) west of Mount Adams, in the western part of the Cascade Range. These "sister and brother" volcanic mountains are approximately 50 miles (80 km) from Mount Rainier, the highest of Cascade volcanoes. Mount Hood, the nearest major volcanic peak in Oregon, is 60 miles (100 km) southeast of Mount St. Helens.. Mount St. Helens is geologically young compared with ...

Mount St. Helens - Wikipedia

A challenge for volcanic risk assessment is the multi-hazard characteristic of volcanic eruptions (Sparks et al., 2013). Tephra falls, pyroclastic density currents (PDCs), lava flows and lahars can occur simultaneously or sequentially and over differing spatial and temporal scales, potentially adversely affecting society (see Table 1 for hazard descriptions).

Volcanic hazard impacts to critical infrastructure: A ...

Throughout July, degassing of the dome and fumarolic activity produced white plumes reaching 3 km. These plumes were dominantly directed towards the SW and SE, and on a few days towards the N and W. Explosions frequently produced white and gray ash plumes up to 11 times per day (figure 83).

SUMMARY. The chapter presents planners with (1) a description of the most hazardous geologic phenomena—earthquakes, volcanoes, and tsunamis—and their effects; (2) a discussion of how to use existing information to assess the hazards associated with these phenomena and incorporate mitigation measures early in an integrated development study; (3) sources of geologic data and maps; and (4) ...

Amphibolite is a non-foliated metamorphic rock that forms through recrystallization under conditions of high viscosity and directed pressure. It is composed primarily of hornblende (amphibole) and plagioclase, usually with very little quartz. The specimen shown above is about two inches (five centimeters) across.

Garnet mica schist in thin section: This is a microscopic view of a garnet grain that has grown in schist. The large black grain is the garnet, the red elongate grains are mica flakes. The black, gray, and white grains are mostly silt or smaller size grains of quartz and feldspar.

Schist: Metamorphic Rock - Pictures, Definition & More

Activity at Kilauea remains at very low levels, with no eruptions anywhere on the volcano, as has been the case since early September. Seismicity and deformation are at background levels, and interestingly, the Hawaiian Volcano Observatory reports that total gas emissions across the volcano are at their lowest levels since before the start of the long-term Pu'u O'o eruption in 1983.
