Lab 1: Colligative Properties & Osmotic Pressure. Water will move from the solution into the cell, causing lysis of the cell. In other words, the cell will expand to the point where it bursts. On the other hand, if a cell is placed into a salt solution in which the salt concentration in the solution is higher than in the cell,...

Lab 1: Colligative Properties & Osmotic Pressure ...

Pre-Lab Discussion. The three colligative properties are boiling point, freezing point, and vapor pressure. They are called colligative properties because they are related to the number and energy of collisions between particles and not to what the particles are. Distinguish between volatile and nonvolatile substances.

Lab 19: Colligative Properties: Freezing-Point Depression ...

properties of a solution are obviously different than the properties of a pure solvent. Some properties differ as a consequence of the number of solute particles in solution. A colligative property is a physical property of solutions that depends upon the concentration of solute molecules or ions, rather than upon the identity of the solute ...

solvated a solute, its properties are going to change. The solvation process involves intermolecular forces of attraction between the solute and solvent particles. The stronger these interactions are the more pronounced the changes to the properties of the solvent. These physical properties of the solution are called colligative properties.

Colligative Properties of Solutions: A Study of Boiling ...

Some colligative properties are vapor pressure lowering, boiling point elevation, freezing point depression and osmotic pressure. When a nonvolatile solute is added to a solvent, the vapor

pressure of the solvent above the solution is less than the vapor pressure above the pure solvent as demonstrated in figure 1.

Related Documents. First, colligative properties are “those of a solution that depend solely on the number of solute particles present, not the identity of those solute particles. These properties include: vapor pressure lowering, boiling point elevation, freezing point depression, and osmotic pressure” (p. 17 lab manual). In this....

Ankur SindhuSep 20, 2011 CHEM 182-DL1 Prof. : Dr. Nidhal Marashi Lab 1: Colligative Properties & Osmotic Pressure Purpose: The purpose of this laboratory was to gain an understanding of the differences between the freezing points of pure solvent to that of a solvent in a solution with a nonvolatile solute, and to compare the two.

Lab 1: Colligative Properties & Osmotic Pressure Essay ...

As noted previously in this module, the colligative properties of a solution depend only on the number, not on the kind, of solute species dissolved. For example, 1 mole of any nonelectrolyte dissolved in 1 kilogram of solvent produces the same lowering of the freezing point as does 1 mole of any other nonelectrolyte.
