When I teach Dimensional Analysis in later units I bring in more complicated problems. Most of my students have already learned how to convert between units in math class using multiplication, but they are not familiar with using dimensional analysis. Therefore it is important to have students realize that this is a new technique.

The point of this example is to remind you that dimensional analysis is applied math, not abstract math. The numbers used should describe the real world in so far as possible and indicate no more accuracy than is appropriate. If you overlook this point, you might have a five-mile walk to the next gas station. Example 7

It's useful for something as simple as distance equals rate times time, but as you go into physics and chemistry and engineering, you'll see much, much, much more, I would say, hairy formulas. When you do the dimensional analysis, it makes sure that the math is working out right. It makes sure that you're getting the right units.
