The water molecule is not linear but bent in a special way. The two hydrogen atoms are bound to the oxygen atom at an angle of  $104.5^\circ$ . The O—H distance (bond length) is 95.7 picometres ( $9.57 \times 10^{-11}$  metres, or  $3.77 \times 10^{-9}$  inches). Because an oxygen atom has a greater electronegativity than a hydrogen atom, the O—H bonds in the water molecule are polar, with the oxygen bearing a ...

A chemist named Lewis offered a third way to look at acids and bases. Instead of looking at hydrogen ions, he looked at pairs of electrons (remember our pictures with dot structures in Atoms and Elements?). In Lewis' view, acids accept pairs of electrons and bases donate pairs of electrons. We know that both of these descriptions of acids and bases use completely opposite terms, but the idea ...

Note the trends: bluer light has shorter, higher  $f$ , and more energy. Redder light has longer, lower  $f$ , and less energy.. At the beginning of the 20th century Max Planck (lived 1858--1947) suggested that atoms can absorb and emit energy in only discrete chunks (called quanta). This quantum behavior of atoms could explain the drop-off of a continuous spectrum's shape at the short wavelength end.

One was particles, localized lumps of stuff that flew about like little bullets. The best investigated of the fundamental particles was the electron. Thomson had found in 1896 that the cathode rays found in cathode ray tubes--the precursor of old fashioned glass TV tubes--were deflected by electric and magnetic fields just as if they were tiny little lumps of electrically charged matter.
