The receiver would bandpass the received signal, pass the result through an A/D converter, perform all the demodulation with digital signal processing systems, and end with a D/A converter to produce the analog message signal. Assume in this problem that the carrier frequency is always a large even multiple of the message signal's bandwidth W .

Putting the above relationships together, the different digital signal processing parameters can be related to each other (Figure 14). Figure 14: Digital signal processing relationships. This can be boiled down to one 'golden equation' of digital signal processing (Figure 15) which related frame size (T) and frequency resolution (Δf):

Introduction to Signal Processing

Digital signal processing (DSP) is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety of signal processing operations. The signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency.
