Convection is the heat transfer due to the bulk movement of molecules within fluids such as gases and liquids, including molten rock (). Convection includes sub-mechanisms of advection (directional bulk-flow transfer of heat), and diffusion (non-directional transfer of energy or mass particles along a concentration gradient).

dissipate heat. This investigation was undertaken to study forced convection heat and mass transfer between air and water set in laminar parallel motion and to examine the influence of the interfacial motion on these transfer rates. Fluid mechanics of the contacting phases, which plays an important role in convection heat and mass transfer, was

### **CONVECTIVE HEAT AND MASS TRANSFER FROM WATER SURFACES**

Convective heat transfer, or convection, is the transfer of heat from one place to another by the movement of fluids, a process that is essentially the transfer of heat via mass transfer. Bulk motion of fluid enhances heat transfer in many physical situations, such as (for example) between a solid surface and the fluid.
