Nope. they are not suggesting different classes. With media queries you can set different css rules based on screen (or media) resolution (width, height, aspect-ratio...) in a single file, or you can include different stylesheet based on the query. I suggest you to follow a tutorial to start using media queries.

html - css for different screen resolutions? - Stack Overflow

Practically, targeting mobile screen resolution is not a good UX, the resolution is too high for the small screen, fonts will be too small to read, icons will be too small to click, etc. So, it's better to make the design based on the actual viewport size!

css - Responsive web design is based on screen resolution ...

Current solution is to use a well-tested framework like Bootstrap, Material Design, or modern technologies like flexbox (that can flip axis horizontal to reverse, for example, at certain screen sizes), CSS Grids, and use of rems, vh, vw, vmin, vmax... – Craig O. Curtis Mar 21 at 19:33.

How to deal with different screen resolutions in CSS?

The width property returns the total width of the user's screen, in pixels. Tip: Use the height property to get the total height of the user's screen.

Screen width Property - W3Schools

Otherwise known as "resolution dependent layouts". Single website, different CSS files for rearranging a website to take advantage of the size available.

Different Stylesheets for Differently Sized Browser ...

The <resolution> CSS data type, used for describing resolutions in media queries, denotes the pixel density of an output device, i.e., its resolution.. On screens, the units are related to CSS inches, centimeters, or pixels, not physical values.. Syntax. The <resolution> data type consists of a strictly positive <number> followed by one of the units listed below.

<resolution> - CSS: Cascading Style Sheets | MDN

width versus device-width. In CSS media the difference between width and device-width can be a bit muddled, so lets expound on that a bit. device-width refers to the width of the device itself, in other words, the screen resolution of the device. Lets say your screen's resolution is 1440 x 900. This means the screen is 1440 pixels across, so it has a device-width of 1440px.

CSS media queries: width versus device-width - JavaScript

This page lists a ton of different devices and media queries that would specifically target that device. That's probably not generally a great practice, but it is helpful to know what the dimensions for all these devices are in a CSS context.

Media Queries for Standard Devices | CSS-Tricks
