### **Electrical Transient In Power Systems**

What people refer to as transients in power systems are the fast and significant changes in system parameters, in most cases caused by equipment outages due to malfunction, natural conditions such as heavy wind, lighting etc, or human errors.

One of the causes of the creation of such transients is that of Lightning. Their mode of action is usually indirect and exerts it through affecting the power line. They generate induced transients by coupling into the power system. Another cause is that of the routine utility tasks which include: Facility load switches.

The fault point of a power system is that point to which the unbalanced connection is attached in the otherwise balanced system. For example, a single line-to-ground fault at bus M makes bus M the fault point of the system and an unbalanced three-phase load at bus N defines N as the fault point.

Transients are power quality disturbances that involve destructive high magnitudes of current and voltage or even both. It may reach thousands of volts and amps even in low voltage systems. However, such phenomena only exist in a very short duration from less than 50 nanoseconds to as long as 50 milliseconds.
