In computer science, a problem is said to have optimal substructure if an optimal solution can be constructed from optimal solutions of its subproblems. This property is used to determine the usefulness of dynamic programming and greedy algorithms for a problem. Typically, a greedy algorithm is used to solve a problem with optimal substructure if it can be proven by induction that this is ...

I once explained (in this post) why so many people prefer to start programming by learning Python. Shortly - it allows very gentle start without overloading one with tons of special concepts - and on the other hand it is not a toy, but industrial-level language, used for development of well-known applications and sites.
