Design of experiments - Wikipedia

De nition. A Latin square design is a design in which three explanatory variables (typically one treatment and two blocking), each of which is categorical with the same number of levels (in this example, four), so that each pair of variables has the same number of observations for each possible pair of levels.

of practical importance. Statistical inference reaches these decisions by comparing the variation in response among those experimental units exposed to the same treatment (experimental error) with that variation among experimental units exposed to different treatments (treatment effect). Thus, the three principles of experimental design are:
