Comparing Viruses And The Bacteria

Viruses are microscopic pathogens that infect living cells and tissues. They are the smallest kind of microbe, with the size ranging from around 20-200 nanometers, around 35 times smaller than a human red blood cell and around 100th the size of a regular bacteria.

Welcome to the Tor Lab Home. The Tor Group is focused on three main areas of research: a) understanding the structure of nucleic acids and developing novel binders targeting specific structures found in bacteria and viruses; b) discovering new fluorescent nucleotides to be used as a probe for understanding nucleic acid structure and function; and c) examining the delivery properties and ...

Antimicrobial resistance (AMR or AR) is the ability of a microbe to resist the effects of medication that once could successfully treat the microbe. The term antibiotic resistance (AR or ABR) is a subset of AMR, as it applies only to bacteria becoming resistant to antibiotics. Resistant microbes are more difficult to treat, requiring alternative medications or higher doses of antimicrobials.

Bacteria are becoming resistant to even the most powerful antibiotics. These expensive, hard-to-treat infections are prompting physicians to reassess using viruses to destroy bacteria.

Are viruses the best weapon for fighting superbugs?

Begin the process of identifying unknown bacteria by observing their physical characteristics, such as cell wall, shape and linkages. Use standard laboratory procedures, like cell staining, culturing and DNA sequencing to further narrow down your identification.

Indicator bacteria are types of bacteria used to detect and estimate the level of fecal contamination of water. They are not dangerous to human health but are used to indicate the presence of a health risk. Each gram of human feces contains approximately ~ 100 billion (1 \times 10 11) bacteria. These bacteria may include species of pathogenic bacteria, such as Salmonella or Campylobacter ...
