In mathematics, a system of linear equations (or linear system) is a collection of two or more linear equations involving the same set of variables. For example, + − = − + = − − + − = is a system of three equations in the three variables x, y, z.A solution to a linear system is an assignment of values to the variables such that all the equations are simultaneously satisfied.

"In Module 4, students use similar triangles learned in Module 3 to explain why the slope of a line is well-defined. Students learn the connection between proportional relationships, lines, and linear equations as they develop ways to represent a line by different equations (y = mx + b, y – y1 = m, etc.). They analyze and solve linear equations and pairs of simultaneous linear equations.

In mathematics, a system of equations is considered overdetermined if there are more equations than unknowns. [citation needed] An overdetermined system is almost always inconsistent (it has no solution) when constructed with random coefficients.However, an overdetermined system will have solutions in some cases, for example if some equation occurs several times in the system, or if some ...

In this section we will discuss how to solve trig equations. The answers to the equations in this section will all be one of the "standard" angles that most students have memorized after a trig class. However, the process used here can be used for any answer regardless of it being one of the standard angles or not.

Chapter 1 LINEAR EQUATIONS 1.1 Introduction to linear equations A linear equation in n unknowns $x_1, x_2, \cdots, x_n$ is an equation of the form $a_1x_1 + a_2x_2 + \cdots + a_nx_n = b$, where $a_1, a_2, ..., a_n, b$ are given real numbers. For example, with x and y instead of x_1 and x_2, the linear equation $2x+3y = 6$ describes the line passing through the points (3, 0) and (0, 2).
